7 reproduction of **working drafts** in any form for use by participants in the standards development process is
8 permitted without prior permission, neither this document nor any extract from it may be reproduced, stored or
9 transmitted in any form for any other purpose without prior written permission from the IWSFG.

10 Once finalized, the IWSFG will permit the downloading and use of the documents without charge for the purposes
11 of determining whether a product is likely to be considered flushable and to be so identified.

12 **Forward**

The International Wastewater Services Flushability Group (IWSFG) is a worldwide coalition of national and regional wastewater services' associations and organizations and individual wastewater services.

The work of preparing the standards is carried out by various drafting groups comprising volunteers designated by the principal and the supporting participants of the group. They participate on a voluntary basis, without remuneration of any kind.

The criteria for flushability and the appropriate test methods are the product of a global consensus of the coalition members and reflect the hydraulic, mechanical and environmental conditions of drain lines, various onsite treatment systems, and wastewater collection and treatment systems as well as the nature of the receiving waters for treatment plant effluents.

The task of the group was to prepare standards reflecting the above purpose.

Wastewater services are organizations acting for the public good as a public service. The group expects the manufacturers and distributors of their products to act in a socially responsible and environmentally sustainable manner by adhering to the established standards.

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. The IWSFG shall not be held responsible for identifying any or all such patent rights.

DRAFT

51

52 1 Introduction

53 Wastewater process systems are designed to receive, treat, and convey sanitary discharges¹ that, after
54 treatment, are subsequently disposed of as:

- 55 a. liquid effluents to the aquatic environments of lakes, rivers, and oceans
- 56 b. solid residuals (biosolids) for application to land for their inherent nutrient values
- 57 c. solid residuals incinerated or digested for energy recovery
- 58 d. solid residuals to be sent to landfill sites

59 Typical waste streams include toilet paper, human waste, food waste, detergents and cleaning agents. In
60 recent years, new products such as moist wipes and toilet bowl cleaning products have been introduced
61 worldwide – many of which are identified as “flushable” products. Other products such as tampons,
62 condoms, and facial tissues are commonly but inappropriately flushed. The physically adverse effects of
63 such products on wastewater systems (clogging and plugging) have already been identified but
64 numerous other environmental effects have not been studied systematically. For example, flushed
65 products may comprise materials and chemicals that can be harmful to the environment; hence, such
66 products should not be identified as “flushable”. Accordingly, the purpose of the flushability test along
67 with others presented in this IWSFG series is to define the qualities and characteristics of those
68 products that may be considered as “flushable”. The application of these test methods and the
69 provision of the appropriate advice to the product users regarding their after use disposal will ultimately
70 lead to the long-term sustainability of wastewater systems and the minimization of potential problems
71 such as pipe blockages and equipment failures in sewer networks.

72 The goal of the IWSFG is not to ban the production and/or use of these products, but to encourage
73 manufacturers to clearly and prominently identify those products that do not meet these tests as not
74 being “flushable” and to encourage users to dispose of the products after use in a more appropriate
75 manner.

76

77 2 Purpose

78 The purpose of the test is to assess the performance of a product, i.e., to clear a toilet bowl, when it is
79 subject to the hydraulic forces and mechanical conditions typically found when placed in and flushed
80 through a toilet, and in particular to assess the likelihood that the product and the water, when flushed:

- 81 a. will clear the toilet bowl and trap, without the need for excessive flushing

¹ In some instances, by agreement with a commercial or industrial client, a wastewater utility may agree to accept discharges containing chemicals or other contaminants not normally found in sanitary discharges. Acceptance is by specific agreement that such chemicals or contaminants can be safely treated within the treatment processes of the wastewater utility. Otherwise pretreatment by the commercial or industrial organization is required to bring the discharge into conformity with the established acceptable quality.

- 82 b. will not, as a result of the product being flushed on its own without toilet paper or fecal
83 matter, reach or overtop the toilet rim during the process

84 **Note:** This test is proposed for general application globally.

85 3 Scope

86 The scope of this Publicly Available Specifications (PAS) includes all of the products that a manufacturer
87 or distributor may wish to identify as being flushable and all products, which by the location of their use
88 and likely contamination by human excreta, are likely to be flushed through a toilet into a drain line and
89 wastewater conveyance and treatment system.

91 4.1 Normative References

92 IWSFG PAS 0:2017 *Terms and Definitions for Determination of Flushability*

93 4.2 Informative References or relevant Annexes

94 Annex 1 – Sources of Apparatus

95 Annex 2 – Photographs of Test Apparatus

96

97 **5 Terms and Definitions**

98 With the exception of the definitions of unit size see: IWSFG PAS 0:2017 *Terms and Definitions for*
99 *Determination of Flushability*

100 5.1 Unit Size – for dry tissues that are not toilet paper, the unit size is 2 tissues as removed
101 from the packaging.

102 5.2 This unit is comprised of a number of multiple joined sheets (typically 6) folded into a
103 square as shown in Figure 1 below. The target mass for this unit is 3 g. Hence, the
104 number of sheets in a unit should be that number which provides as close to 3 g of total
105 material as is practical.

106

107

Figure 1: Folding of Toilet Tissue into a “Unit Size”

109

110 SOURCE: FG501 - Toilet Bowl & Drain-Line Clearance Test, INDA, 4.3 Simulated Fecal Material
111 and Toilet Tissue.

112

113

114 5.3 Unit Size – moist tissues

115 one tissue or the maximum number of the product that may be flushed according to the
116 manufacturer's instructions or recommendations provided on the packaging

117 5.4 Unit Size – other products

118 one product or the maximum number of the product that may be flushed according to
119 the manufacturer's instructions or recommendations provided on the packaging

120 6 Principles

121 The flushability test is used to demonstrate a product's potential to successfully exit a toilet when
122 subjected to the hydraulic forces and mechanical configuration of toilets normally used, without
123 the use of a plunger.

124 The test will demonstrate the likelihood that when flushed:

- 125 a. the product will clear the toilet bowl and trap without the need for excessive flushing
126 b. the water in the bowl will not, as a result of the product being flushed on its own without
127 excreta, reach or overlap the toilet bowl during the process.

128 The test provides evidence that the product will clear the toilet ready for transport through a private
129 drain line within 5 of toilet flushes. A positive result in this test indicates that the test product flushed
130 satisfactorily down the toilet.

131 **Note:** The test is undertaken using potable water, as opposed to wastewater because:

- 132 a. This avoids the health and safety issues associated with wastewater.
133 b. This avoids the inconsistencies that would inevitably be found between two or more
134 samples of wastewater.

135

136 7 Apparatus

137 The apparatus comprises:

- 138 a. a siphonic toilet having a flushing capacity of $4.5 \text{ L} \pm 0.4 \text{ L}$
139 b. a mounting platform on which the toilet is secured

140 The mounting platform should be sufficiently high as to allow the collection of the flushed material and
141 may be such that a drain line can be connected for use in the Drain Line Flow Test (IWSFG PAS 2B or
142 IWSFG PAS 2B (UK)) and/or the Drain Line Snagging Test (IWSFG PAS 2C).

143 The toilet should be connected to a municipal water supply.

144 If the toilet is connected to a drain line, the line should be vented near the toilet to prevent the
145 development of a vacuum in the line.

146 Note: Photographs of a representative test system can be found in Annex 2.

147 Optional equipment:

- 148 a. a suitable container (e.g. plastic bucket) to capture the flushed material, etc. for transfer to a
149 drain line or to verify the volume of a flush

150

151 8 Preparation

152 8.1 Sample Acquisition

153 For products already in the marketplace, the testing laboratory shall select and acquire
154 sample products from retail outlets (e.g., grocery stores or pharmacies).

155 For products under development as a new or an improved product, the testing
156 laboratory may receive samples from their manufacturers or from the intended
157 distributors.

158 The test report shall clearly indicate the applicable method of sample acquisition and
159 its purpose.

160 8.2 Number of Test Pieces

161 Ten specimens are required for each complete testing. Specimens should be obtained
162 from at least two distinct packages of a product. To obtain 5 specimens, a roll of toilet
163 paper, or a bundle of wipes in its original package should be divided into 5 equal
164 sections. Then, one specimen from each section will be used for testing.

165 For toilet papers, the starting point, as well as the end point of a toilet paper roll, should
166 be avoided due to glue effect.

167 To obtain moist tissue specimens, it will be convenient to turn the packaging on its side
168 to view the entire bundle of moist tissues. Then, the package will be divided into 5
169 equal sections, and a specimen will be removed from each section.

170 Caution is necessary not to damage delicate specimens when removing them from the
171 package. Also specimens must be removed immediately before the testing starts.

172

173 8.3 Sample Preparation

174 The following requirements apply to products to be tested

175

176 8.3.1 Dry Tissues:

177 The sample shall comprise one unit of toilet paper or one unit of dry tissues.

178

179
180
181
182
183

8.3.2 Moist Tissues

The sample shall comprise one unit of moist tissue taken directly from the packaging, unless the manufacturer's instructions recommend a maximum, in which case the maximum loading per flush suggested by the manufacturer should be used and recorded in the test report.

184
185
186
187

Moist tissues shall be tested as removed from the package. No attempt at removing the lotion should be undertaken and the removed moist tissue should not be left for any length of time, to reduce the opportunity for the moisture to start evaporating.

188

189

8.3.3 Other Products

190
191

For other products, a unit is comprised of one specimen taken directly from the package.

192

193

8.4 Apparatus

194
195
196

Upon set-up and prior to conducting a test, perform three flush actions without a test product and collect the flush for measurement to establish a baseline flush for the toilet and to ensure its correct operation.

197
198

Prior to initiating a flush, ensure that the toilet has stopped running and that the water in the bowl is at a normal level.

199

The average of the three flushes should be $4.5 \text{ L} \pm 0.4 \text{ L}$.

200

201

202

When a toilet testing configuration is used over an extended period of time, the verification of the flushing volume should be periodically repeated to verify the toilet's performance.

203

204

9 Storage and Conditioning

205

206

9.1 Storage of samples

207

208

Samples shall be stored under ambient laboratory conditions in the manufacturer's original packaging.

209

210

However, if the samples have been removed from the manufacturer's original packaging, the samples shall be identified and stored as follows:

211

212

1. Dry products should be returned to their original packaging, and should be double-bagged with resealable plastic bags.

- 213 2. Moist products should be kept in their original packaging, e.g., hard-plastic
214 containers or soft-plastic packages.
215 3. In case of hard-plastic boxes, the box should be closed, and then should be
216 double-bagged with plastic resealable plastic bags to minimize any exposure to
217 the ambient air.
218 4. Soft-plastic packages should be closed tightly while squeezing the air out of the
219 package, and then should be double-bagged with resealable plastic bags to
220 minimize the potential of exposure to the ambient air.
221 5. Samples shall be stored in secured laboratory cabinets.

222

223 9.2 Conditioning for the test

224 There are no conditioning requirements. The test specimens should be removed from
225 their packagings (if any) and used directly in the test procedure.

226

227 10 Procedure

228 10.1 Summary

229 The test consists of ten toilet flush sequences using the test specimens, and the loading
230 levels provided by the manufacturer's instructions or the normal anticipated usage.
231 After each flush, observations are made regarding whether the specimen has cleared
232 the toilet bowl and trap.

233 If the toilet is connected to a drain line for a combined toilet bowl clearance and drain
234 line flow test, the location of the specimen in the drain line is recorded following each
235 flush.

236

237 10.2 Test procedure

238 The following steps should be undertaken:

- 239 1. Prior to adding any articles to the toilet or initiating a flush, ensure that the
240 toilet has stopped running and that the water in the bowl is at a normal level.
241 2. Place the specimens (as specified in Section 6.3) flat on the surface of the water
242 in the center of the toilet bowl.
243 3. Wait 10 seconds, for the specimen to become saturated.
244 4. Activate the flush mechanism.
245 5. After each flush, inspect the toilet bowl and the receiving container (or drain
246 line if attached to the toilet) to determine if the specimen has exited the toilet.
247 6. If any test specimen has not cleared the toilet, wait 3 minutes and repeat

248 further empty flushes 3 minutes apart to a maximum of 5 until specimen has
249 cleared the toilet, while recording the location of specimen after each subsequent
250 flush.

251 **Notes:**

- 252 1. If the test is being carried out in association with a drain line flow test (IWSFG
253 PAS 2B: 2017 or a IWSFG 2B (UK): 2017), the time between the flushes should be
254 extended to 5 minutes.
- 255 2. At no time, should a plunger be required to empty the toilet during the test
256 sequence. If a plunger must be used, the specimen will be deemed to have
257 failed the toilet clearance test.
- 258
- 259 3. If any flush sequence requires more than 5 flushes for a specimen to clear the
260 toilet, abort that test sequence, record the event on the test data sheet, empty
261 the toilet, perform a flush without a specimen to confirm a proper flushing
262 action, and commence the next flush sequence by repeating steps 2 to 5. If any
263 specimen requires more than 2 flushes to clear the toilet bowl, the failure of
264 that particular test should be noted in the test report.
- 265 4. Record the outcome (observations) according to Table 1.
- 266 5. When all of the specimens have exited the toilet, wait 3 minutes for the toilet to
267 empty and commence the next flush sequence by repeating steps 2 to 5.
- 268 6. Repeat the test sequence a total of 10 times to complete the test.

269

270
271
272
273

Table 1: Procedures to Follow after Each Flush Based on Observations of Toilet and Drain Line (if connected).

Observation	Procedures to Follow
Specimen clears the bowl or trap following the 1 st flush.	<ol style="list-style-type: none"> 1. Allow 3 minutes for the water and the flushed articles to equilibrate within the receiving container. 2. Continue with the next empty flush in the sequence.
Specimen remains in the bowl or trap with sufficient capacity in the bowl to accommodate water from a 2 nd flush.	<ol style="list-style-type: none"> 1. Allow the toilet to refill and perform a second flush. 2. If the specimen does not clear the bowl and trap, record the following: <ol style="list-style-type: none"> a) the need for a 3rd flush b) the identity of the specimen in the container 3. Continue with the next empty flush in the sequence.
Specimen still remains in the bowl or trap following a 3 rd flush. Visual evidence of clogging (e.g. rise in water level) with insufficient capacity in the bowl to accommodate a further flush.	<ol style="list-style-type: none"> 1. The specific flush test has failed. 2. Continue with the next designated flush in the series.

274
275

276 10.3 Test Termination

277

278 Upon completion of a round of testing, the toilet shall be drained and cleared of any
279 residues from the test specimen.

280 In cases where specimens contain fiber-binding chemicals that are likely to remain on the
281 toilet bowl surfaces, the surfaces shall be washed using solvents such as ethanol and
282 methanol, or soap and water.

283

284 10.4 Calculations

285 The following calculations are required:

- 286 a. the percentage of the 10 tests in which specimens exited the toilet with no
287 more than 3 flushes

288

289 11 Acceptance Criteria

290 To be acceptable:

- 291 a. No test sequence can require more than 3 flushes for the test specimen to clear the bowl.
292 b. No test sequence required the use of a plunger for the specimen to clear the bowl.
293 c. The toilet bowl water is not surcharged up to its rim.

294 Note: None of the 10 flush sequences containing a test specimen should fail to meet the above
295 criteria.

296

297 12 Test Report

298 The test report should include the following information:

- 299 a. a reference to this test procedure
300 b. an overview of the test procedure including the toilet type
301 c. the date and location of the testing procedure
302 d. the complete identification of the tested product
303 e. a statement as to the acquisition process followed and purpose of testing
304 f. the dimensions and weights of the specimens
305 g. the number of specimens used per flush
306 h. any departure from the procedure and any circumstances that may have affected the results
307 along with an explanation of such departure
308 i. the confirmation of the average flush volume at the start and end of the test
309 j. copies of photographs taken during the procedure
310 k. the test results, including:

- 311 1. the percentage of the 10 tests in which the specimens exited the toilet with no more
312 than three flushes
313 2. for each individual test:
314 a. the number of flushes required for the specimen to clear the toilet bowl
315 b. any rise of the level of water in the toilet bowl
316 3. any specimen failure, due to either clogging or product remaining in the toilet bowl or
317 trap:
318 a. after three consecutive flushes
319 b. resulting in the water rising in the toilet bowl to overflow the rim
320 c. a statement indicating whether the product passed or failed the test
321

322 13 Precision

323 Periodically the toilets used should be checked for their correct operation (flapper/check valve, fill line)
324 and their delivery of the correct flush volume. They should be adjusted to meet the manufacturer's
325 specifications as required. Also there may be some variation in the quality of the products being tested,
326 which is why 10 separate specimens shall be acquired and tested, according to Section 8.1.

349

350

Annex 1 – Sources of Apparatus

351

(Informative)

352

All of the apparatus required for this test is readily available in hardware stores and plumbing outlets.

353

It is recommended that toilets used should be certified as to conforming to the applicable national

354

standards. The mounting platform for the toilet (and for drain lines if attached) can be constructed using

355

readily available lumber.
